RE: GEOFFREY CROWTHER DOB: 51

ACCT#1

Destill Toyoe,

I am writing in regards to my patient and your client, Geoffrey Crowther, and your letter sent to me on October 16, 2008 requesting a narrative report, which follows.

Mr. Crowther was initially evaluated by me in this office on January 27, 2006. He had been followed by the Hand Service previously for a degenerative joint condition in his left thumb, and was referred for a question of left cervical radicular pain. His employment history was notable for work over the course of 31 years time from 1975 to 2006 as a track laborer for a railroad injury. He worked doing heavy duty manual labor, welding, repairing railroad tracks, and was exposed thereby to a significant amount of repetitive stremous motion, vibration, awkward postures, heavy lifting and loading of his axial spine.

He complained in the office of neck pain radiating down the left arm as far distally as his wrist, and his physical examination was notable for decreased range of motion of the neck with pain with full extension and lateral bend. His shoulder exam was benign with no impringement nor any instability. He had some decreased sensation noted to light touch consistent with a C6 radiculitis. Imaging was obtained and was notable for C5-6 and C6-7 level disc narrowing with foraminal encreachment.

An MRI scan was ordered and the patient was followed up on March 1, 2006. The MRI was notable for a C5 to C7 neuroforaminal
